Wisql is a graphical user interface to the Sybase SQL Server product.
You can use this wisql 'master' window to enter SQL code and
submit it to the server with the Execute button. You could save
a SQL query that you liked, using the File menu, so that you could use
it again later.

You could print or save the results of your query using the Results menu.

Or you could pick a table of interest and find out things about it, like
the names of its fields (Choose Table and Show Fields).

Or you can use the 'EZ' (easy) report generator or data editor to make
simple formatted reports or to correct or enter data.

TO GET MORE HELP: Use Control and the first mouse button to get help
on any of the objects you see on the screen; 'ctrl-click' on them by holding
down ctrl (like a shift key) and clicking. This help mechanism will work in
all the major windows of wisql.

Also, in every major wisql screen you will see a menu button labelled
'Help...',
beneath which is a menu of 3 basic help topics: General, FastKeys, and
HowTo. If you choose one of these you will get general information about the
screen's function, a list of the 'magic' keystrokes which work in
it, or a brief guide to using it.
